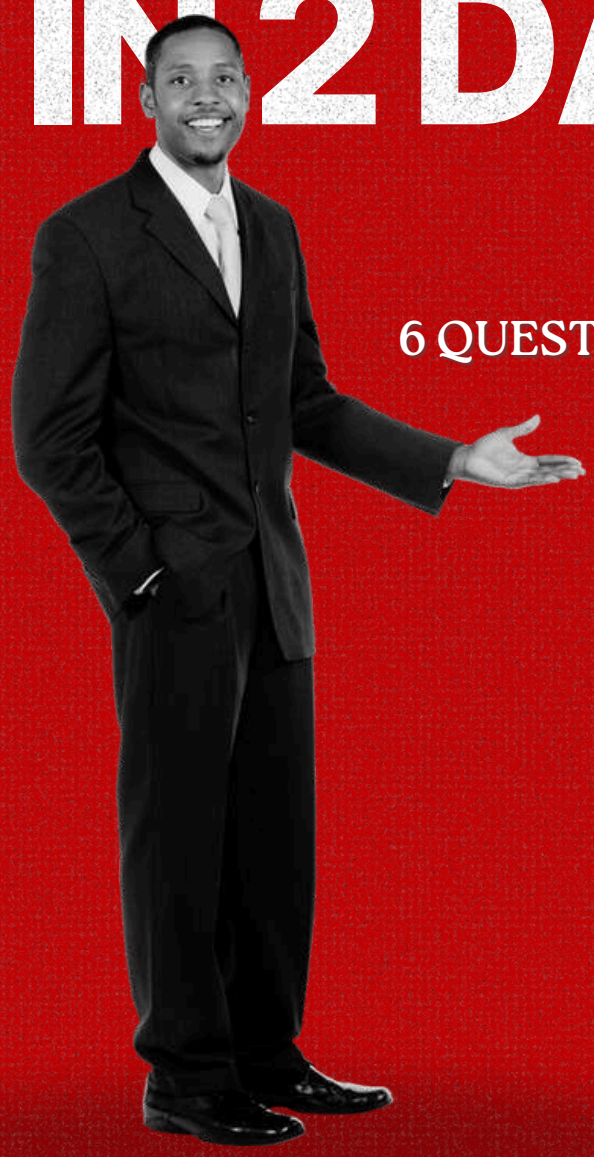
# I HAVE A JOB INTERVIEW IN 2 DAYS



6 QUESTIONS TO PRACTICE

@dicarvalho.prof

# HEY, I KNOW YOU'RE SCARED.

## BUT YOU'VE GOT THIS!
## I BELIEVE IN YOU!

Also,you're resume was impressive enough for you to get an interview, so I think you're good.

Now come with me. We'll see some questions you might have to answer together so you know what to expect.

# THE MOST COMMON QUESTION

## "TELL ME ABOUT YOURSELF."

**Strategy:** Use a Present, Past, Future structure. Keep it under 2 minutes.

**Sample Answer Snippet:** "I'm a solution-driven Software Engineer with five years of experience, currently specializing in full-stack development using React and Node.js at [Current Company Name]. Over the past few years, I've focused on building scalable cloud infrastructure, significantly improving system reliability. I'm now looking to transition to a company like yours, where I can apply my expertise in [specific skill] to contribute directly to a product with such a strong focus on [mention a specific company project/value]."

# YOUR MOTIVE

WHY DO YOU WANT TO WORK FOR [COMPANY]?

**Guidance:** Personalize your answer. Reference the company's mission, products, or culture—show you did your research.

**Sample Answer Snippet:** "I've been following [Company Name]'s commitment to [mention a specific product/value] for a while. What particularly excites me is [mention a recent project or challenge you read about]. I see a genuine opportunity to use my expertise in [relevant skill] to directly contribute to your goals in [mention their department/team area] and solve problems at a scale that truly impacts users."

# SKILL

## "DESCRIBE A CHALLENGING TECHNICAL PROBLEM YOU SOLVED."

**Strategy:** Focus on the complexity and your process—not just the result.

**Sample Answer Snippet (STAR):** "In my last project, we faced a critical performance bottleneck in our main API, significantly impacting user load times (Situation/Task). I initiated a deep-dive, profiling the database queries and ultimately identifying an inefficient data model. My key Action was to propose and lead the implementation of a caching layer using Redis, alongside optimizing the worst-performing SQL queries. The Result was a 60% reduction in average API response time, which directly improved our user experience scores and prepared the service for increased traffic."

# SOFT SKILLS

## "HOW DO YOU HANDLE DISAGREEMENTS WITH A COWORKER ABOUT A TECHNICAL APPROACH?"

**Strategy:** Show you prioritize the best outcome through data and collaboration.

**Sample Answer Snippet:** "I believe in data-driven decision-making. If a coworker and I disagree, my first step is to listen and understand their perspective fully. I would then suggest we run a quick proof-of-concept or research the best-practice documentation for both approaches. For example, on a recent project, my teammate favored one framework while I preferred another. We agreed to implement a small test with both, which clearly showed one had better performance metrics, and we moved forward with the superior option. The focus is always on the project's success, not personal preference."

# RELEVANCE

"HOW DO YOU STAY UPDATED WITH THE LATEST TECHNOLOGIES IN THE TECH INDUSTRY?"

**Strategy:** Show a commitment to continuous learning and name specific sources/activities.

**Sample Answer Snippet:** "I dedicate time each week to continuous learning. I follow key industry leaders on GitHub and LinkedIn, subscribe to tech newsletters like [Name a newsletter/blog], and regularly complete focused courses on [e.g., Coursera/Udemy] covering emerging areas like serverless architecture or AI integration. Most recently, I completed a deep dive into [mention a recent specific tech] to assess its viability for our future roadmap."

# TECHNIQUE

"EXPLAIN THE DIFFERENCE BETWEEN SQL AND NOSQL DATABASES."

**Guidance:** Define their structure and their use cases.

**Sample Answer Snippet:** "SQL databases are relational and schema-based (like tables with predefined columns), ensuring strong consistency, which makes them ideal for complex transactions or data that requires rigid structure. NoSQL databases are non-relational and schema-less; they are typically document, key-value, or graph stores. This flexibility makes them better suited for handling high volume, fast reads, and rapid scalability where the data structure might change frequently."

# TEACHER'S ADVICE

## YOU DON'T HAVE TO BE PERFECT, BUT YOU HAVE TO SELL

Most people think being humble is a virtue, but truth is: if you're not fair to yourself nobody will be. Take a minute to think about the things you archived and be proud of yourself. This way you can be honest about your background without sounding like a peacock.

You've got this! Good luck

Aquela vaga que você sempre quis está disponível, mas você não se sente pronto o suficiente? Neste ebook eu te conto um pouquinho do que esperar para uma preparação de elite.
